Field of the Invention This invention relates to the field of high-power-density batteries that can be easily recharged. More particularly, the invention relates to a battery that can be recharged with relatively low applied electric current. The battery, which has improved safety characteristics, is particularly advantageous for use with electronic devices that do not require high-power-density cells when used at full capacity. The battery can be used in a wide variety of applications, including electronic devices. 2. Description of the Related Art Electronic devices often use one or more cells to store and supply electric power during operation of the electronic devices. For example, a cell can be used to provide a relatively large current that can be used for illumination, sensing, and/or powering an electronic device. Typically, the current supplied by the cell is not constant, but rather is applied in a pulse to the electronic device. The capacity of the cell can be reduced or the cell can be removed from the electronic device when the capacity of the cell has been depleted. The capacity of the cell can also be increased when the cell is used to power an electronic device. Unfortunately, however, conventional cells are inefficient at providing power to the electronic device. Consequently, it is relatively costly to remove or replace the cell when it has been depleted, or to replace a depleted cell with a new cell. Accordingly, an improved battery would be useful.Favorize Your Stay In Minnesota Discover f678ea9f9e
